Oceans & Fisheries in a Changing World

The world's oceans are experiencing a number of impacts from human activities such as fishing and climate change. In this talk, Dr. Tyler Eddy will highlight recent efforts by the Fisheries and Marine Ecosystem Model Intercomparison Project (FishMIP) to understand past and future impacts of climate change and fishing on marine ecosystems, which was developed using the Intergovernmental Panel on Climate Change (IPCC) framework. Dr. Eddy will also speak about projected impacts on Newfoundland & Labrador and new projects that are being developed to further this knowledge.
