The good, the bad, and the ugly: Exploring invasion genetics of high-risk invasive plants in the US mid-Atlantic with undergrads

An introduced lineage of the common reed, *Phragmites australis*, has been aggressively invading estuarine habitats throughout North America for ca. 150 years. In this talk, I'll share how these invasions have provided a way to engage undergraduate students in cutting-edge, interdisciplinary research that directly impacts the management of Virginia's natural resources.
