

LABORATORY PROCEDURES TO BE FOLLOWED WHEN HANDLING UNFIXED HUMAN BLOOD, TISSUES OR BODY FLUIDS (HBBF)

All human source material can potentially transmit infection. The agents of primary concern are Hepatitis viruses A, B and C as well as HIV. However, any infectious agent present may be transmitted by handling infected material. Blood represents the body fluid of highest risk but all body fluids and tissues should be handled as if they have the potential to transmit disease.

N.B. These guidelines are similar to the Containment Level 2 practices outlined by the Public Health Agency of Canada.

1. ALWAYS WEAR GLOVES WHEN HANDLING HUMAN SOURCE MATERIAL.
2. Change gloves between patients. Do not wash and reuse gloves. Follow the correct procedure for removing used gloves.
3. WASH YOUR HANDS THOROUGHLY WITH SOAP AND WATER WHEN CHANGING OR DISCARDING GLOVES OR WHEN WORK IS COMPLETED.
4. Wear safety glasses (or face shield if there is any danger of splash or splatter).
5. Wear a long sleeved lab coat (fastened). A plastic apron may also be necessary if large volumes of blood are to be handled.
6. Use special care when handling sharps (e.g., needles, scalpels, glassware) to avoid cuts and stab wounds.
7. All materials in contact with or contaminated by blood must be disposed of into designated biohazard waste containers.
8. NO HUMAN SOURCE MATERIAL OR ANYTHING CONTAMINATED BY IT IS TO BE DISCARDED INTO IN THE REGULAR GARBAGE.
9. All equipment and work surfaces must be disinfected after use. Bleach solution prepared according to the Guidelines for using Sodium Hypochlorite as a Disinfectant for Biological Waste is recommended. Equipment may require a less corrosive disinfectant.
10. NO MOUTH PIPETTING.
11. NO FOOD OR DRINK IN THE LAB AREA
12. Use leak proof containers and secondary containers if necessary for transportation between labs.

13. If blood is spilled it must be cleaned up immediately.

- Wearing gloves cover the spill with paper towel or other absorbent material and gently pour bleach onto the spill being careful not to splash. Allow 10 minutes for inactivation then collect absorbed blood and disinfectant and discard into a designated container. Remove and discard gloves and wash hands thoroughly.

14. If you cut or stab yourself with items contaminated with blood, wash the wound with soap and running water immediately and continue for 5 minutes. Squeeze or scrub the area around the wound to induce bleeding if possible.

- GET MEDICAL ADVICE IMMEDIATELY BY REPORTING TO WORKPLACE HEALTH IN SUPPORT SERVICES BUILDING ROOM 4159.
- For eye exposures, flush eyes under eyewash for 10 minutes and get medical assistance.
- If the source of the contaminating blood is known take this information with you to the medical office.

15. Personnel must receive Biosafety training before starting laboratory procedures

For information on the next Biosafety training course, see the website:
<http://www.uwo.ca/hr/learning/required/index.html>

16. Hepatitis B immunization is recommended (see Hepatitis B Immunization Policy).

17. Procedures generating aerosols* must be carried out in a biological safety cabinet or the procedure enclosed. Centrifugation should be carried out in closed containers.

* Procedures generating aerosols:

- Pipetting liquids
- Centrifugation
- Sonicating, blending or grinding tissues
- Vortexing uncapped tubes
- Opening pop-top micro-tubes
- Penetrating rubber septum-closed vials by needle
- Reconstituting lyophilized cultures
- many electronic devices (e.g., cell counter, plate washers, multiwell analyzers)
